

Lecture 06 - Java and Spring Boot

→ when we create Spring boot starter project it creates Maven Project

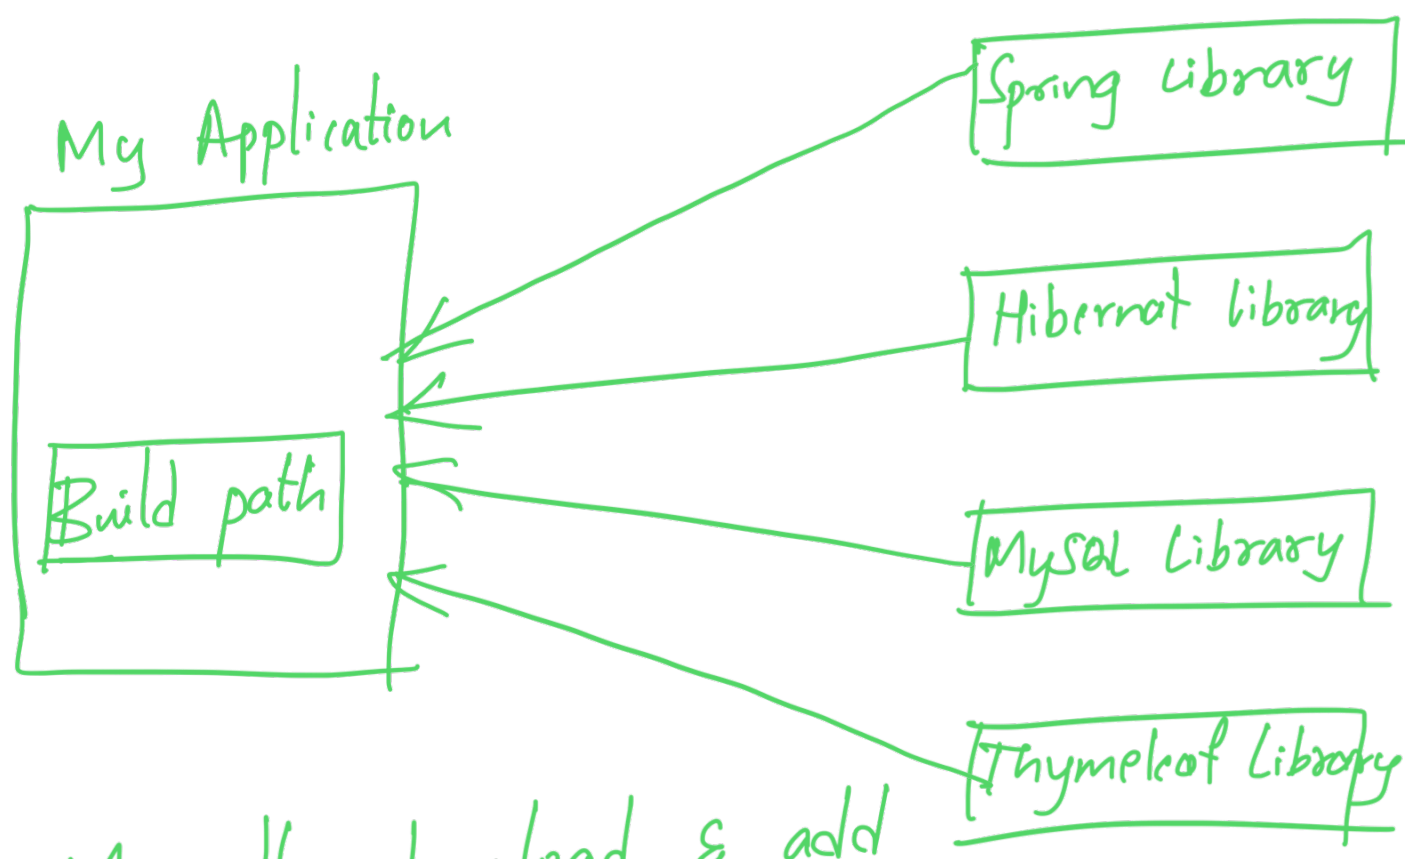

What is Maven?

→ It is a Build tool

→ It is popular

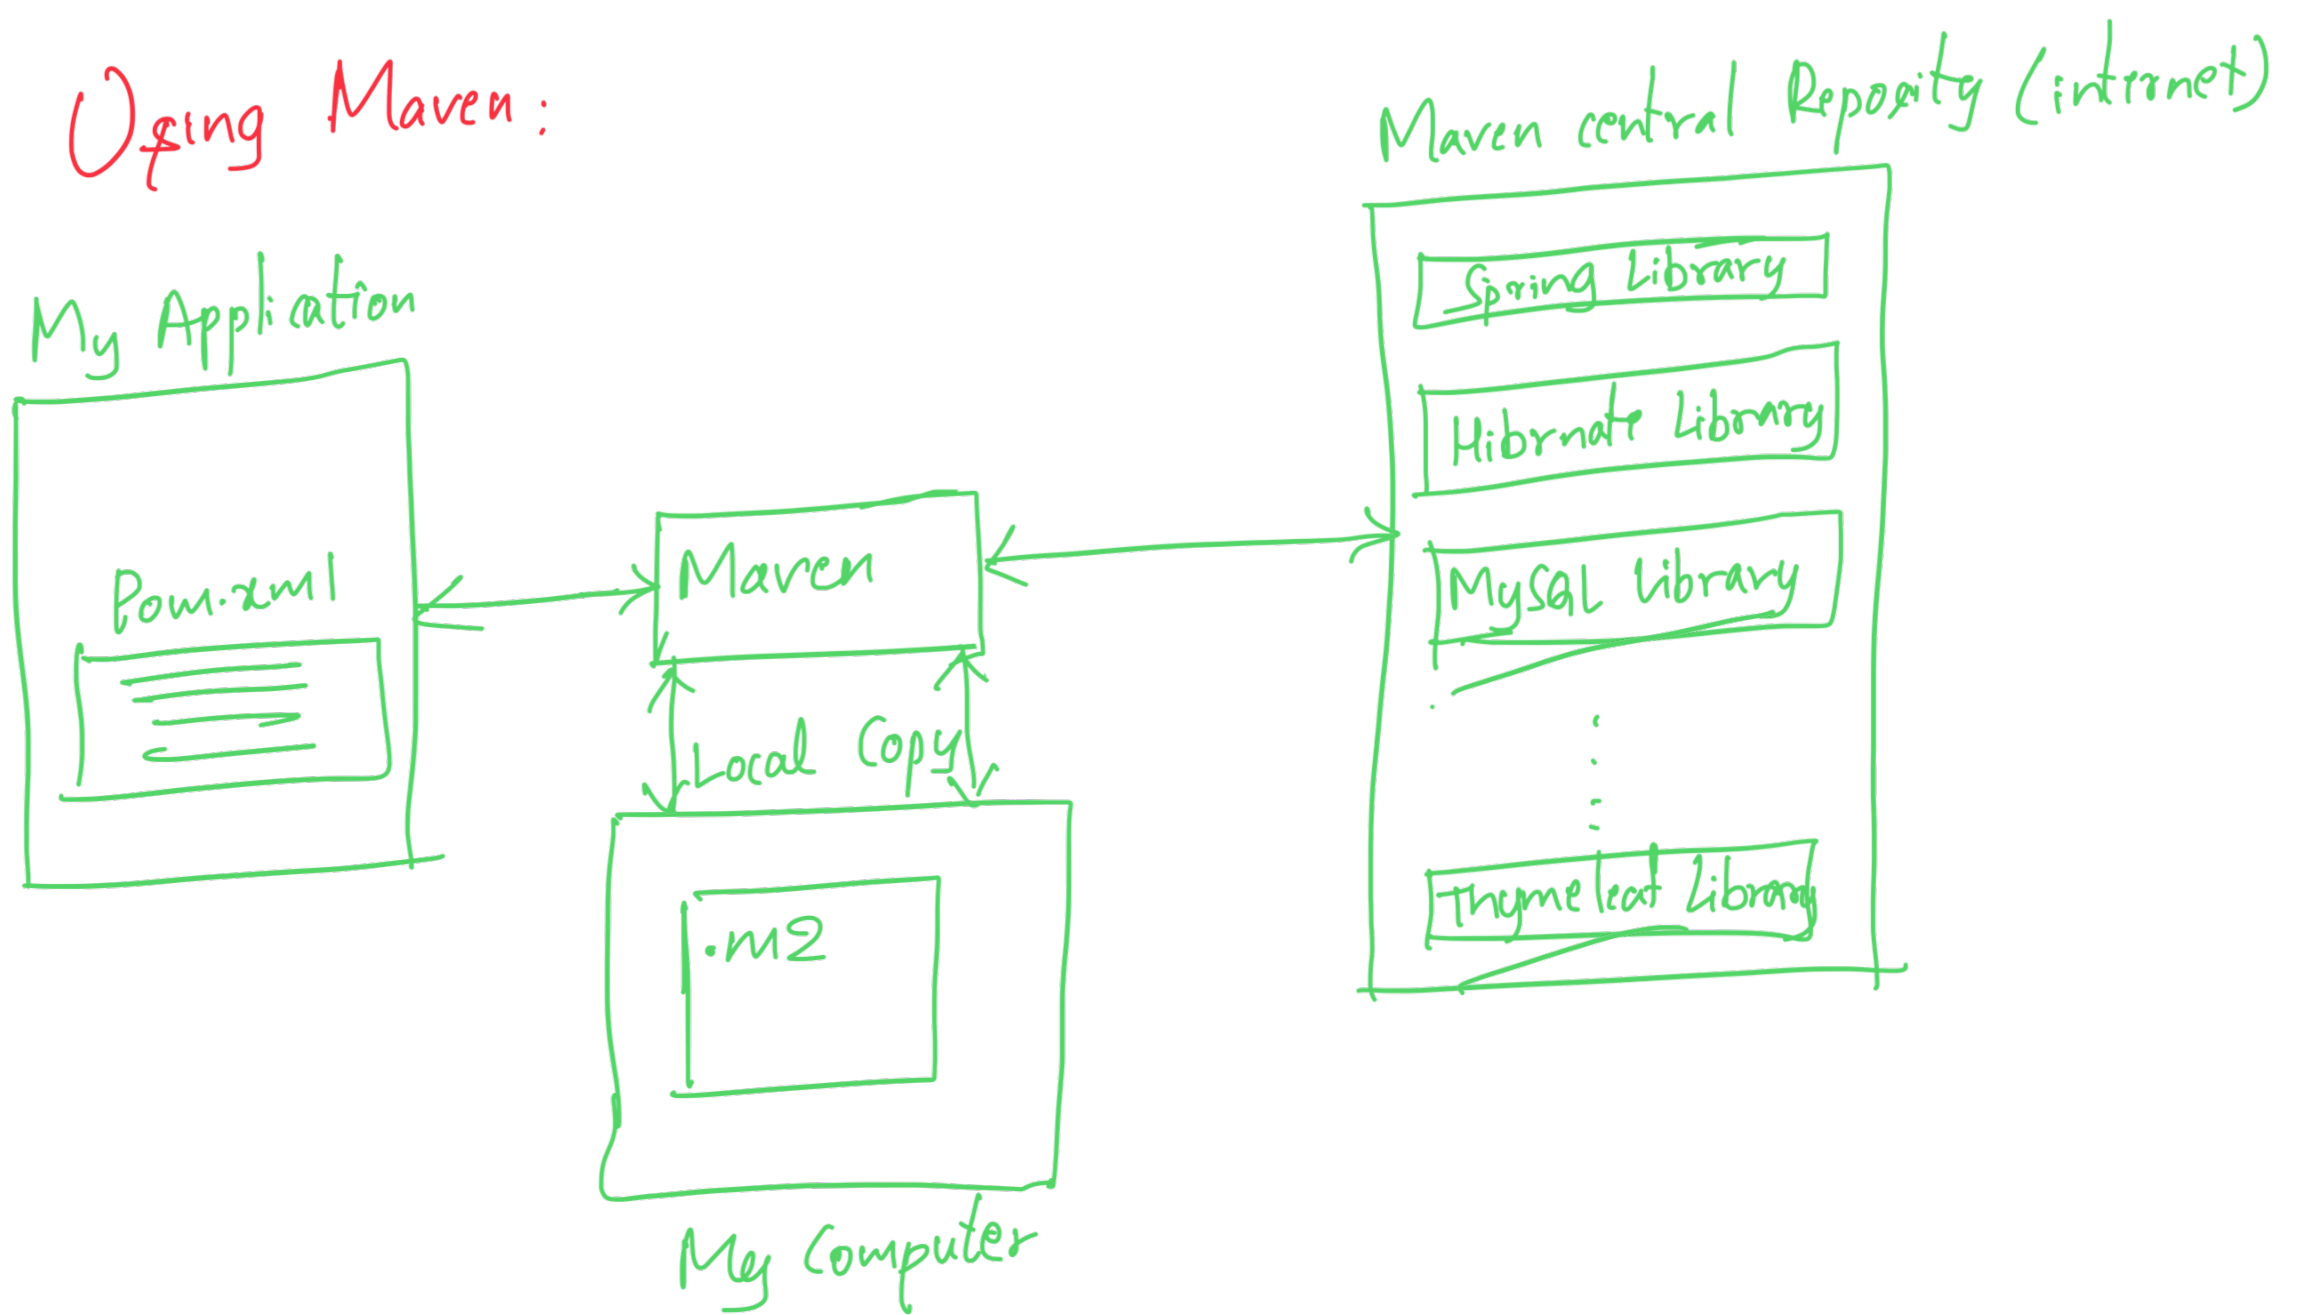

→ It manages the dependencies required for the project

What problem it solves?

* Manually download & add to Build path

Using Maven:

* Maven will pull the dependencies from Internet

* It will pull the transitive dependencies

* It will save the copy of it in local system for future reference
